

Habitat Map

Directions:

1. Select a regional wildlife species and notify your instructor of your choice so no two students select the same species.
2. Using all available resources, research and determine the ideal habitat for the species by locating the correct types of cover, food, water and home range.
3. Using your findings, create a detailed map of a refuge designed by you for your species. Maps can be hand drawn or computer generated, but must include all habitat elements.
4. Create a citation sheet listing all sources used.
5. Share your maps with the class.
